

Galactic AI Designer Technical Verification Report

Implementation evidence, test results, generated artifacts, and technical constraints

Verified final app state: generated space texture with editable GALACTIC team name fitted to the chest.

Verification result

The tested workflow generated the requested space-themed uniform, extracted and placed the GALACTIC team name, produced coordinated visual marks, and exported a 360-degree video artifact.

Prepared June 17, 2026

1. Technical Summary

The workflow was tested in the local Besu Customs application using the exact Galactic prompt. The application generated a coordinated space-themed jersey and shorts texture, extracted the team name, created an editable GALACTIC chest layer, fitted it to the garment, and exported a 360-degree video.

Implementation status: VERIFIED

Automatic team-name extraction, editable chest placement, improved initial sizing, AI texture generation, generated logo/monogram content, and 360-degree video export are demonstrated in this report.

Exact test prompt

Prompt used without rewriting

Create a basketball uniform that includes a jersey and shorts for a team called the Galactic using outer space themes, like the moon,, comets

Generated artifacts

Deliverable	File	Status
Technical report	besu-galactic-technical-verification.pdf	VERIFIED
360-degree video	galactic-uniform-technical-demo.mp4	VERIFIED

Technical boundary

The implemented sizing adjustment resolves the oversized-text behavior shown in the earlier screenshot. Tucked-garment geometry requires a compatible 3D model. Four-concept generation requires additional orchestration, persistence, selection UI, and generation-cost controls.

2. Live Prompt & Generation Evidence

The exact Galactic prompt entered in the Besu AI Design step before generation.

3. Generated Result

Generated cosmic garment texture with Team Name detected as GALACTIC and a dedicated editable team-name layer.

4. Final Fitted Chest Text

The chest placement logic was tightened so long team names start at a practical scale. GALACTIC is shown as an editable Oswald text layer at 23px, visibly contained within the jersey torso instead of overflowing the garment.

Final verified state after applying the chest placement preset.

5. Feasibility & Technical Constraints

Request	Decision	Verified outcome / boundary
Automatically add team name from prompt	DONE	GALACTIC was detected and created as a separate editable chest text layer.
Fit text shoulder-to-shoulder by default	DONE	Shared placement now uses a narrower target width and smaller bounds; the verified result fits at 23px.
Create a team logo	DONE / AI-VARIABLE	This run generated coordinated G marks on the chest/shorts. AI artwork varies. A guaranteed, separately editable vector-logo generator would be a future feature.
Tucked jersey and visible waistline	MODEL-DEPENDENT	The silhouette is defined by the selected GLB model, not the prompt. A compatible tucked model can be swapped in; creating one requires modeling, UV work, rigging, and QA.
Generate four uniform options at once	ADDITIONAL WORKFLOW	Technically feasible, but requires multi-generation orchestration, cost/rate controls, result persistence, and a selection workflow.
360-degree video export	DONE	A five-second H.264 MP4 was exported and is supplied with this report.

Verified behavior and constraints

Team-name extraction, fitted editable text, generated visual marks, and video export are demonstrated. A tucked silhouette depends on a different 3D asset, while multi-concept generation requires an additional application workflow.

Operational notes

AI texture and logo details are generative, so individual visual output can vary while the editable name-placement behavior remains deterministic. The app retains manual editing so users can reposition or restyle the generated team name after the first-fit default.

6. 360-Degree Video Verification

Frames sampled from the MP4 show the generated uniform rotating through front, side, back, and opposite-side views.

Property	Verified value
File	galactic-uniform-technical-demo.mp4
Format	H.264 MP4
Duration	5 seconds
Resolution	1920 x 886 at 30 fps

7. Source Reference Record

The following source images are included to preserve the visual requirements and comparison context.

Marked ChatGPT reference identifying team-name and logo details.

Earlier app screenshot documenting the oversized Besu text issue now addressed by the fitted default.

Reference for the proposed four-concept selection workflow, classified as future scope.

Clean ChatGPT reference output supplied for visual comparison.

Earlier Besu app prompt/result context supplied with the feedback.
