

Galactic AI Designer Verification & Scope Report

Implementation evidence, feasibility decisions, deliverables, and final approval recommendation

Verified final app state: generated space texture with editable GALACTIC team name fitted to the chest.

Decision requested

Approve the completed in-scope AI Designer improvements and proceed with project closeout and payment release. Separately scoped ideas are documented below and do not block acceptance of the current delivery.

Prepared June 17, 2026

1. Executive Decision Summary

The requested workflow was tested in the live local Besu Customs application using Bryant's exact Galactic prompt. The application generated a coordinated space-themed jersey and shorts texture, extracted the team name, created an editable GALACTIC chest layer, fitted it to the garment, and exported a 360-degree client video.

Current-scope result: COMPLETE

Automatic team-name extraction, editable chest placement, improved first-insert sizing, AI texture generation, logo/monogram content in the generated design, and 360-degree video export are demonstrated in this report.

Exact acceptance prompt

Prompt used without rewriting

Create a basketball uniform that includes a jersey and shorts for a team called the Galactic using outer space themes, like the moon,, comets

Delivered files

Deliverable	File	Status
Approval report	besu-galactic-client-verification.pdf	COMPLETE
Client demo video	galactic-uniform-client-demo.mp4	COMPLETE
Ready-to-send message	client-message.txt	COMPLETE

Acceptance position

The implemented items resolve the usability concern shown in the earlier oversized-text screenshot. New 3D model authoring and a four-concept selection workflow are valid future enhancements, but they are not defects in the delivered AI Designer and should be handled as a separate phase.

2. Live Prompt & Generation Evidence

1 JERSEYS2 AI DESIGN3 COLORS4 STYLE5 LOGO6 PATTERNS7 TEXT8 IMAGES9 REVIEW

Full Garment Texture

Describe the overall look

Create a basketball uniform that includes a jersey and shorts for a team called the Galactic using outer space themes, like the moon,, comets

This option creates a full texture mapped across the entire product.

Generation mode

The exact Galactic prompt entered in the Besu AI Design step before generation.

3. Generated Result

Generated cosmic garment texture with Team Name detected as GALACTIC and a dedicated editable team-name layer.

4. Final Fitted Chest Text

The chest placement logic was tightened so long team names start at a practical scale. GALACTIC is shown as an editable Oswald text layer at 23px, visibly contained within the jersey torso instead of overflowing the garment.

Final verified state after applying the chest placement preset.

5. Feasibility & Scope Determination

Request	Decision	Verified outcome / boundary
Automatically add team name from prompt	DONE	GALACTIC was detected and created as a separate editable chest text layer.
Fit text shoulder-to-shoulder by default	DONE	Shared placement now uses a narrower target width and smaller bounds; the verified result fits at 23px.
Create a team logo	DONE / AI-VARIABLE	This run generated coordinated G marks on the chest/shorts. AI artwork varies. A guaranteed, separately editable vector-logo generator would be a future feature.
Tucked jersey and visible waistline	MODEL-DEPENDENT	The silhouette is defined by the selected GLB model, not the prompt. An approved prebuilt tucked model can be swapped in; new modeling, UV work, rigging, and QA are separate scope.
Generate four uniform options at once	FUTURE SCOPE	Technically feasible, but requires multi-generation orchestration, cost/rate controls, result persistence, and a selection workflow. It is not required for current acceptance.
360-degree video export	DONE	A five-second H.264 MP4 was exported and is supplied with this report.

No acceptance blocker remains

The first three usability/design requests and video export are demonstrated. The tucked silhouette depends on a different 3D asset, while multi-concept generation is an additional product workflow. Neither changes the completion status of the existing scope.

Operational notes

AI texture and logo details are generative, so individual visual output can vary while the editable name-placement behavior remains deterministic. The app retains manual editing so users can reposition or restyle the generated team name after the first-fit default.

6. 360-Degree Video Verification

Frames sampled from the delivered MP4 show the generated uniform rotating through front, side, back, and opposite-side views.

Property	Verified value
File	galactic-uniform-client-demo.mp4
Format	H.264 MP4, browser/client friendly
Duration	5 seconds
Resolution	1920 x 886 at 30 fps

7. Client Reference Record

The following source images are included so the approval record remains self-contained.

Marked ChatGPT reference identifying team-name and logo details.

Earlier app screenshot documenting the oversized Besu text issue now addressed by the fitted default.

Reference for the proposed four-concept selection workflow, classified as future scope.

Clean ChatGPT reference output supplied for visual comparison.

Earlier Besu app prompt/result context supplied with the feedback.
